

## AutoIn Manual

### 1. Use Flow:

1. Double-click to open software “AutoIn.exe”, icon is shown as below: (usually it will be on the desktop next to the JZZP icon) (Ideally it will start with the computer so you can ignore this step)

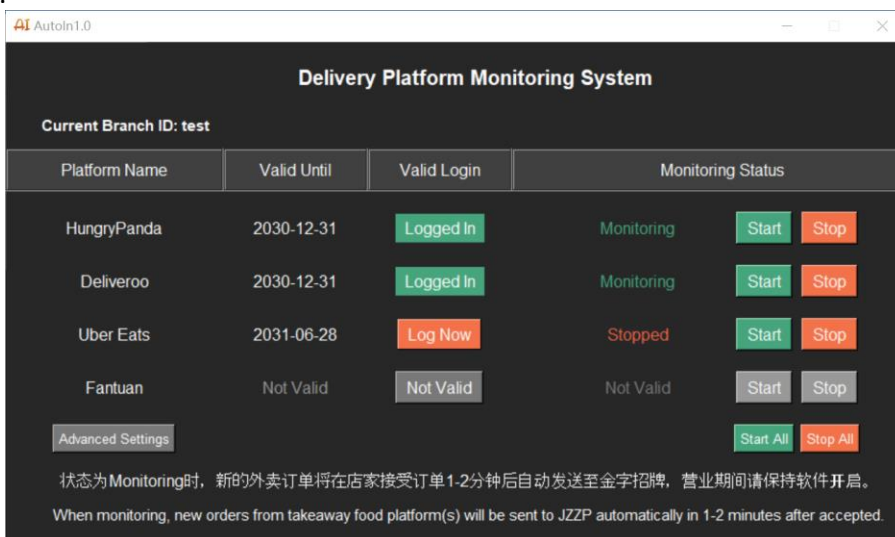

2. After the software is opened, it will first spend about 20 seconds checking login status and information, showing “Checking...” in the “Valid Login” column

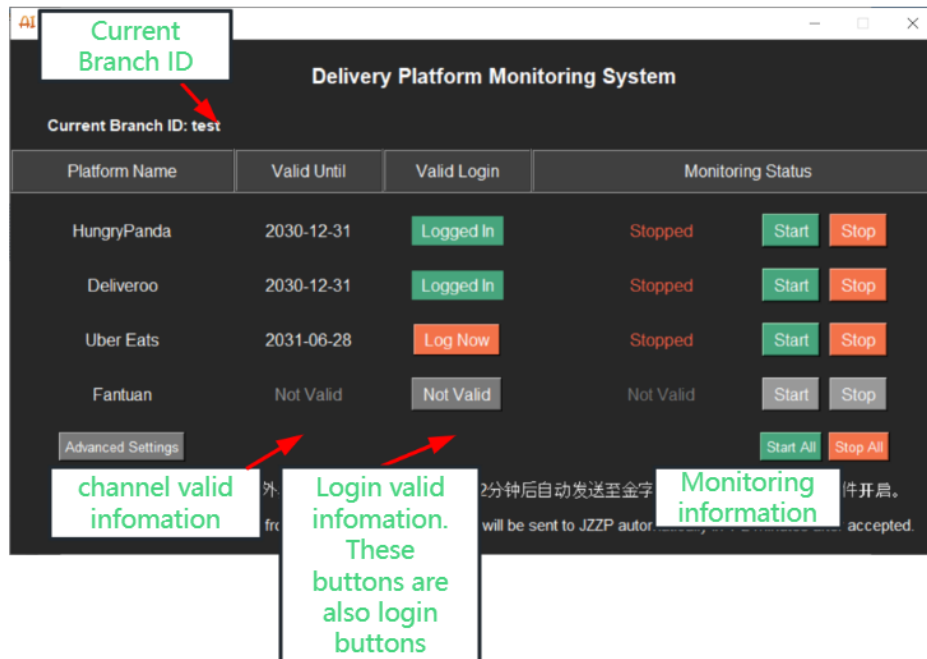

3. When the check finishes, according to the preset needs of each store, some platforms will start monitoring automatically, the user can also control it manually by clicking “Start” and “Stop”. (Note: For HungryPanda platform, we are currently unable to fetch taste and set menu information)

For Example, for the “test” branch, HungryPanda and Deliveroo are preset to be needing monitoring, so these two platforms will automatically start monitoring, no operation from user would be needed.

4. Done. New orders from take-away food platforms that have started monitoring will be automatically sent to epos system JZZP within 1-2 minutes after the store has accepted the order. Please do not close the software during your opening time.

## 2. User Interface

Advance Settings include:

Frequency setting: the frequency is defined as "check whether there are new orders every X seconds on the take-out platforms being monitored". The monitoring frequency can be set as required, and the default setting is 1, that is, stop for one second between every two checks.

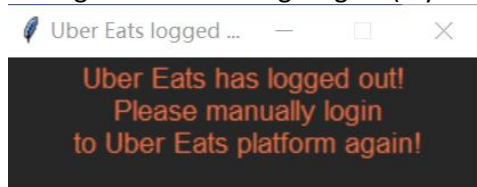

Open a browser: open a browser, and the login status is consistent with the current login status of the software. Users do not need to use this function unless there are some special needs

Test SQL connection: users do not need to use this function

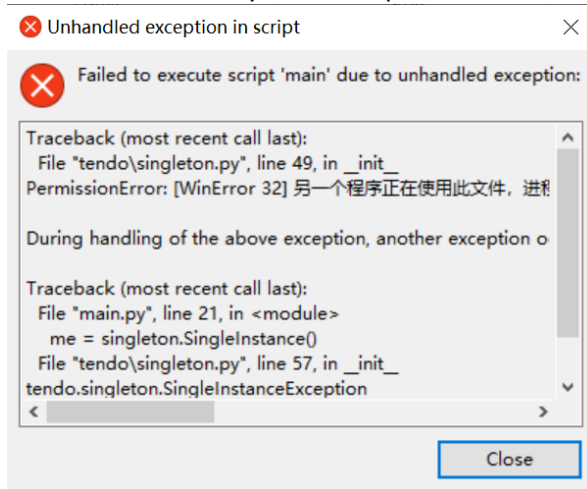

## 3、 Common issues and PS

1. The login information will be input when we install this software for you, you don't need to use login functions if there is no change to your login information.

2. Clicking the "Start" button of each platform will NOT immediately detect whether the login of the platform is valid. If the login status is invalid or the login status has expired, the following prompt will be displayed in about 10 seconds. You can click "Log Now" Button in the "Valid Login" column to login again (If you have the login information).

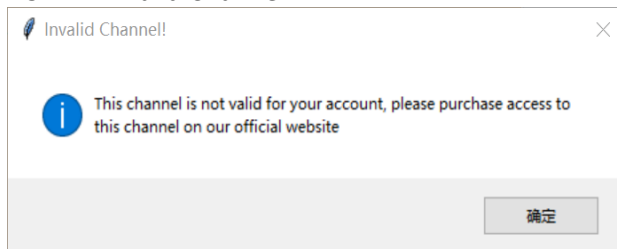

3. "Start All" is equivalent to clicking "Start" on the platform with all channels effective, and "Stop All" is alike
4. Too many instances problem

If the above prompt shows up when trying to open the software, it means there is already an instance opened in your computer, you can't have two or more instances of this software opened. Please check your taskbar and look for this icon, click it and the software will appear:

#### 5. Invalid Channel

When the above prompt appears, it means that the channel of the branch is invalid or the validity period has expired. Please consider topping up

6. Currently Supported takeaway platforms: HungryPanda、Deliveroo、Uber Eats、Fantuan
